

Abstract

Process and device for switching digital television programs.

A process for switching television programs is wherein it detects (8, 9) and then stores (10) the appended data of intra type of programs other than the selected program, selects (10) and decodes (12), upon a command (14) for the switching over to a new program, the stored appended data relating to this new program, and temporarily transmits (13), while awaiting the decoding and transmission of the current data of the new program, the decoded appended data.

Applications relate for example to the perusing of programs.
